

## High pressure grouting machine

The high pressure grouting machine shall be carried out by pouring special high-pressure grouting waterproof material through the hihh-presure perfusion equipment into the concrete crack structure and extending untill all the gaps are filled. After the water (water injection) is accompanied by crossing-linking reaction. High pressure thrust and secondary osmotic pressure will be applied to the elastomer. Press into and fits all gaps, to achieve the purpose of leakage, it can be said that the best one of the performance of the plugging material

Model	GD999
Power	220V, 50Hz, 810W
Output	0-0.8L/min
Max. Working Pressure	18000PSI
High Pressure Pipe safety range	<14000PSI
Switching valve safety range	<18000PSI
Weight	7.5Kg
